#### Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

The invention discloses a method (claim 1) of service provisioning in a telecommunications system. The system comprises configurations of SSP which provide services to users. More than one service capability servers are involved in the provision of services. The corresponding arrangement (claim 13) is also disclosed.

Such a method and arrangement are disclosed in the closest prior art D1=WO01/88739.

The difference between D1 and the present invention is that there is a direct interaction through a connection between the service capability servers.

The problem solved by said feature is that the in an open service architecture information cannot be shared between service capability servers. The present invention proposes to use a direct interaction through a connection between said servers. The service capability servers are communicating with each other without the interference of any other element.

The document Do does not disclose the problem of exchanging information between capability servers. Do does not provide any hint at providing a direct connection between the servers.

Therefore, the subject-matter of claims 1 and 13 is new and inventive.
